Forward

The Washington State Fuel Mix Disclosure process is designed to provide utilities an assessment of their mix of fuel sources associated with the generation of the electricity used to serve their customer demand. The data supporting the process includes tabulated datasets from utilities and public agencies, as well as manually entered data.

If you have any questions about the information contained in this report, contact our office at 360-725-3112.

About the Washington State Electric Utilities Fuel Mix

The fuel mix disclosure law, RCW 19.29A, requires Washington State utilities to report to electricity consumers the sources of power they use to serve them. The law defines how the utility “fuel mix” should be calculated, which fuel categories to use, and how utilities should share this information with customers. The Department of Commerce (Commerce) collects the data supporting this effort; the fuel mix values and associated carbon dioxide emissions are calculated and summarized for utility and state level mix information.

How is a utility's fuel mix determined?

The objective of the fuel mix disclosure process is to inform customers and policy makers about the characteristics of the electricity delivered by each retail supplier to consumers and businesses. Most retail suppliers use electricity from multiple sources, even if they operate their own power plants. In some cases retail suppliers obtain power without knowing the specific generation source. Power serving Washington utilities comes from three sources: 1) specific power plants, 2) the Bonneville Power Administration (BPA), and 3) unspecified power (labelled market purchases in the utility reports). Unspecified power is electricity obtained in a transaction where the seller does not identify a specific generating source, typically through short-term transactions in the bulk power markets.

In order to build a fuel mix picture for each utility, Commerce uses information reported by each utility about the quantity (megawatt-hours) of electricity from specific generating plants. The fuel source for the specified generating plants is provided by the U.S. Energy Information Administration (EIA). The fuel mix law requires that a utility have documentation of ownership or contractual rights from a specific generating facility in order to report a claim on that resource. To protect against double-counting of renewable energy sources, Commerce relies on the ownership of renewable energy certificates as evidence that the utility owns the right to make this claim.

Many utilities serve their retail customers using electricity provided by BPA, and BPA provides Commerce with information about the mix of resources used to generate this electricity.

The fuel mix law requires that Commerce assign fuel characteristics to power from unspecified sources based on the characteristics of all unclaimed power sources on the grid after specific plant claims have been removed from the total available power. This unclaimed, or residual power, is called the “net system power mix.”

The fuel mix law defines the power grid, for the purpose of calculating the net system power mix, as the electricity generated within the U.S. portion of the Northwest Power Pool. The Northwest Power Pool (NWPP) includes Washington, Oregon, Idaho, Utah, and parts of California, Montana, Wyoming and Nevada. Resources from this region are included in the calculation regardless of whether there is any evidence that they are used to serve Washington customers. It does not include resources in the Canadian portion of the Northwest Power Pool or most resources in California.

The equation for determining the net system power mix is: System Power Generated in the NWPP (U.S. portion only) minus Power Claimed from Specific Plant Sources equals the remaining power, or Net System Power Mix. The specific fuel sources for the Net System Power in the NWPP region are identified and are used to determine a NWPP Net System Fuel Mix.

The specified claims from Washington and Oregon¹ account for about 41 percent of all generation in the NWPP. The residual 69 percent is used to calculate the fuel characteristics of the net system power mix. For each utility, Commerce assigns fuel characteristics in proportion to the resources in the net system power mix. For example, 33 percent of the net system power mix consists of coal-fired power. Therefore if a utility has 100 MWh of unspecified power, Commerce will add 33 MWh of coal to the utility’s total claims for coal-fired power.

One effect of this calculation is that a utility’s fuel mix will usually include some fossil fuel generation even if it does not own or contract for power from those specific resources. About 25 percent of the coal and 18 percent of the natural gas in Washington’s overall fuel mix results directly from the net system power mix calculation. A utility can avoid this effect only by identifying all of the electricity sources used to serve its retail customers.

¹ Washington Department of Commerce produces a Fuel Mix Disclosure report for the state of Oregon. Accordingly, resource claims made by Oregon utilities are subtracted from the NWPP power generation.

What is the source of information for this report?

The fuel mix law requires that Commerce base the net system mix calculation on “actual generation by fuel mix in the Northwest power pool for the prior calendar year” and specifies that Commerce publish the net system mix calculation “on or before May 1st of each year, or as soon thereafter as practicable once the data [...] is available.”

The U.S. Energy Information Administration (EIA) publishes generation and fuel consumption data for each power plant in the United States in its report EIA-923. EIA publishes its “early release” version of the EIA-923 report on approximately August 31 each year for the previous calendar year. The “early release” version is subject to revision after publication. The EIA reports are available at: www.eia.gov/electricity/data/eia923/.

Washington state electricity sector emissions are determined using the prorated EIA-923 fuel consumption information for all state power claims in combination with fuel specific emission rate data. Commerce has developed fuel specific emission rate database using information available from the EIA and the U.S. Environmental Protection Agency.

How is information presented in this report?

State level fuel mix information, expressed as power, fuel type and emissions, is presented first. The state level information is the aggregate of all of the calculated individual utility fuel mix values. The Northwest Power Pool (NWPP) Net System Mix information is described next and details the market power component of the state fuel mix. Following these tables and figures is a full description of the fuel mix for each electric utility in the State.

Notes and changes for 2017

- Several minor changes were made to the Fuel Mix Disclosure software for 2017 that improved its functionality.
- After receiving their final 2017 Fuel Mix reports several Oregon utilities requested adjustments and/or corrections to their utility reports.
- For the 2016 and 2017 Fuel Mix Disclosure reports the output from several power plants that are located outside of the NWPP, and which contribute only a portion of their power to utilities in the NWPP, were adjusted. Only the electric power used in the NWPP was recognized as being part of NWPP power generation. This change in accounting reduces the size of the NWPP power generation and as well as the net system mix.
- For the 2016 and 2017 reports the output from the Intermountain coal-fired power plant in Utah was removed from the Fuel Mix Disclosure calculation. This is a dedicated power plant that was built around 1980 to provide electricity specifically to about twenty five municipal utilities located in California and Utah.

- An estimate of the BPA Canadian Entitlement was made and treated as a claim against the BPA resource mix and thereby removed from the NWPP net system mix.
- Electricity supplied by BPA to public utilities in Idaho, Montana, Wyoming and Nevada was claimed against the BPA resource mix and removed from the NWPP net system mix.
- Electricity provided by Avista to its Idaho customers was claimed against the power generation resources listed by Avista in its Washington Fuel Mix Disclosure. This removed previously unclaimed electric power from these Avista resource's thereby removing it from the NWPP net system mix.
- Electricity provided by PacifiCorp to its California, Idaho, Utah and Wyoming customers was claimed against the power generation resources listed by PacifiCorp for its Oregon Fuel Mix Disclosure. This removed previously unclaimed electric power from these generation resources and removes it from the NWPP net system mix.
- Electric power provided by Consumer Choice Aggregators to customers in California and claimed against specific NWPP resources was removed from the NWPP net system mix.
- Electric power delivered by some Pacific Northwest power marketers to industrial and commercial customers in Oregon and Washington, which could be linked to a generating resource, was removed from the NWPP net system mix.
- Electricity provided by behind-the-meter entities such as Solar City was estimated using an EIA data set and was added as a NWPP resource.
- The above adjustments reduce the NWPP net system mix by approximately 35 percent.

Glossary

- “Claims on Resources” refers to power obtained from specific generation facilities, with fuel source information obtained from the US Energy Information Administration.
- “Market Purchases” refers to power obtained without known (specified) fuel sources. Commerce calculates and assigns a fuel mix to power obtained on the market.
- “BPA Resource Mix” includes only the portion of delivered BPA power that can be attributed to specific plants. The portion of BPA power that cannot be connected with a specified plant or fuel source is treated as unspecified (labeled Market Power in the report).
- “BPA Claims” includes only the portion of delivered BPA power that can be attributed to specific plants.
- Residual BPA Resource Mix: the portion of the BPA Resource Mix that is not claimed by Washington or Oregon utilities is incorporated into the NWPP Net System Mix.
- “BPA Market” is the portion of delivered BPA power that BPA purchased on the market and/or from another system without knowledge of specific plant or fuel sources.
- “BPA Slice Wind w/o RECs” includes a small amount of wind power that is not bundled with the Renewable Energy Credits (RECs) associated with that power. Such power is assigned the net system fuel mix, as though it were a market purchase.

Washington State Electric Utilities: 2017 Graphs and Tables

Washington State Aggregate Fuel Mix

The Washington “fuel mix” is the state aggregate of fuel sources associated with the electricity delivered by all electric utilities to end users in the state of Washington, including Bonneville Power Administration’s direct electricity sales. It includes all electric power that is used to serve retail customers that is owned, purchased under contract, or purchased on the spot market.

Northwest Power Pool Fuel Mix and Net System Fuel Mix

Figure 5 and Table 5 show the mix of generation resources for the NWPP in 2017. Once Commerce removes all Oregon and Washington utilities' specified claims, and unclaimed renewables,² the result is the net system fuel mix of the NWPP, which is in Table 6.

Figure 5: Northwest Power Pool Generation 2017

² Certain residual renewables power resources (solar, wind, landfill gas and geothermal) are removed from the Net System Mix. These resources are used for Renewable Portfolio Standard compliance by other states in the NWPP region and California. There is also an adjustment for "dedicated" BPA generation resources, which are used outside of Washington and Oregon.

Table 5: 2017 Northwest Power Total Generation³

³ Net power plant generation is used in the WA fuel mix disclosure process. Some entities report power as gross generation, which does not include power plant parasitic losses. As noted on page 3 some resources were removed from the NWPP total.

Figure 6: Northwest Power Pool Net System Fuel Mix: Carbon Dioxide Emissions 2016

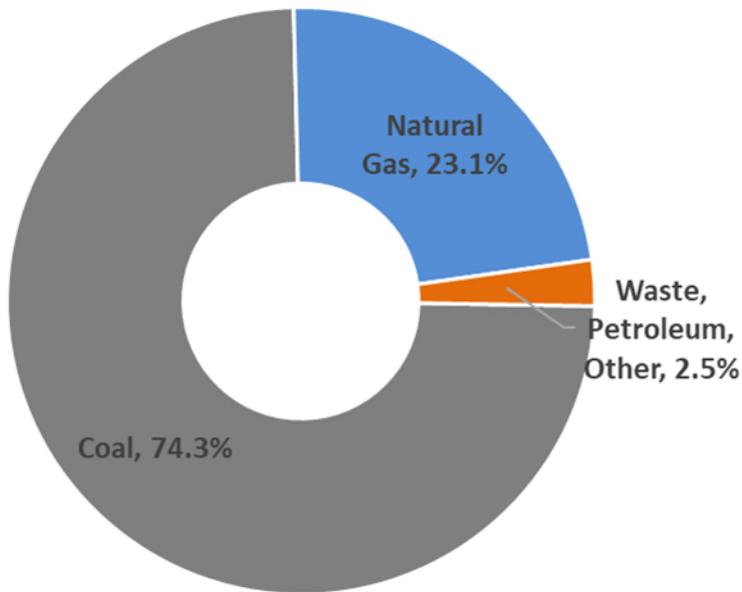

Table 7: Northwest Power Pool Net System Fuel Mix: Primary Emissions 2017

Carbon Dioxide Emissions	Short Tons	Metric Tons
Coal	28,950,389	26,264,812
Natural Gas	9,011,455	8,175,509
Waste, Petroleum, Other	987,294	895,708
Total	38,949,138	35,336,029
